The invention relates to a vaccine for protection against Flavivirus infection comprising a dimeric 80% envelope (B), which has been secreted as a recombinantly produced protein from Drosophila Schneider cells and which represents the N-terminal 80% portion of the protein from residue 1-395. Also included are a method for protecting a subject against a remunogenic composition for protecting a subject against a immunogenic polypeptide comprising a dimeric 80% B, an immunogenic polypeptide and a carrier, an immunodiagnostic comprising the immunogenic polypeptide and a carrier, an immunodiagnostic comprising the immunogenic polypeptide and a carrier, an immunodiagnostic host recombinant DNA expression system, a DNA sequence encoding the immunogenic polypeptide and an immunodiagnostic kit for detecting recomprising DRA. In DRA-2, DEN-3 or DEN-4, The immunogenic polypeptide and an immunodiagnostic kit for detecting proteins of serotypes comprising DRA-1, DEN-2, DEN-3 or DEN-4. The Plavivirus is a dengue virus. The 80% B protein is products are envelope proteins of serotypes comprising DRA-1, DEN-2, DEN-3 or DEN-4. The comprising a helix-turn-helix peptide, to encourage dimerisation. The vaccine is useful for protection against dengue virus infection (e.g. bengue haemorrhagic fever, DHF, and Dengue shock syndrome, DSS). The
                                                                                                                                                                                                                                                                                                                                                                                                          present sequence is the partial genomic sequence of the DEN-2 strain
PR159/S1 virus, encoding the capsid, membrane, envelope and NS1 proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     virucide; vaccine; Plavivirus; dimeric 80%E; Drosophila Schneider cell; immunogenic composition; multivalent immunodiagnostic; dengue virus; viral capsid; prM gene; E gene; NSI gene; ds.

The invention describes a vaccine that generates a protective,

concurrilaring antibody response to a Flavivirus in a murine host. The

vaccine comprises a therapeutic amount of a dimeric 80%E, the dimeric

80%E having been secreted as a recombinantly produced protein from

80%E having been secreted as a recombinantly produced protein from

80%E having been secreted as a recombinantly produced protein from

80%E corporation of the protein from residues 1-355. Also described are: an

80% corporation of the protein from residues 1-355. Also described are: an

80% corporation of the protein from residues 1-355. Also described are: an

80% corporation of the protein from residues 1-355. Also described are: an

80% corporation of the protein from residues 1-355. Also described are: an

80% communogenic composition that generates a protective, neutralising

80% antibody response to a Flavivirus in a murine host, comprising the above

80% comprising the above immunogenic of Flavivirus in a test

80% condition in municable support phase coated with dimeric 80% and

80% comprision is useful for the detection of Flavivirus in a test

80% comprision is useful for the detection of Flavivirus in a test

80% comprision is useful for the preventing or diagnosing infections caused

80% comprision is useful for preventing or diagnosing infections caused

vaccine viruses of the invention. This sequence is based on the nucleotide sequence encoding the polyprotein from Dengue 2 virus, strain 16681. The polyprotein from Dengue 2 virus, strain 16681. The polyprotein comprises the capaid, prw, w. B. NS1, NS2A, NS2B, NS3B, NS3A, NS4A, NS4B and NS5 proteins. The quadravalent vaccine of the invention comprises an attenuated Dengue virus clone, PDK-53, and a chimeric DEN-2/3 virus, and/or a chimeric DEN-2/3 virus, and/or a chimeric DEN-2/4 virus. The new quadravalent vaccines are used to protect against infection by all four serotypes of dengue virus, DEN-1, DEN-2, DEN-3 and DEN-4, which can lead to dengue fever or fatal dengue haemorrhagic fever/dengue shock syndrome (DHF/DSS). Host cells are used to produce the recombinant protein products of the DNA constructs which are used in the vaccines. (Updated on 27-AUG-2003 to correct OS field.)
                      sequence represents the nucleotide sequence of one of the candidiate

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                           This invention relates to a novel immunogenic composition being unteravalent and containing a common nucleotide deletion in the 3' untranslated region of dengue types 1, 2, 3, and 4. The invention may be useful for the development of compounds with a virucide or immunostimulant activity or as a vaccine. The tetravalent vaccine is useful in the prevention of disease in humans caused by dengue virus. Unlike previous tetravalent vaccine, the new tetravalent vaccine is unique since they contain a common shared attenuating mutation which eliminates the possibility of generating a virulent wild type virus in a subject to be vaccinated since each component of the vaccine possesses the same delta30 attenuating deletion mutation. The vaccine also is able to induce humoral and cellular responses against al of the (non-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DENI virus, strain S275/90 was isolated from the serum of a dengue haemorrhagic fever (DHP) parient. RNA was isolated from the virus and used to prepare CDNA encoding DENI polypeptides. Dengue Virus Type I prods. can be used for detection, diagnosis, vaccines (inactivated form) or treatment of DENI infections. The sequences given in AAQ51477-86 are oligonucleotides used to prepare CDNA fragments corresp. to Dengue virus proteins, by PCR. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 27-AUG-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Flavivirus; Dengue virus; DEN; vaccine; infection; virucidal; avirulent; immunogenic; viral disease; pharmaceutical; chimeric; ss.

The invention relates to avirulent, immunogenic flavivirus chimeras comprising amino acid mutations in the non-structural proteins of a flavivirus. Chimeric viruses containing the attenuation-mutated non-structural genes of the virus are used as backbone into which the structural protein genes of a second flavivirus strain are inserted. These chimeric viruses elicit pronounced immunogenicity but lack the accompanying clinical symptoms of viral disease. Attenuated chimeric flaviviruses are combined in a pharmaceutical composition to confer simultaneous immunity against several strains of pathogenic flaviviruses immunity against several strains of pathogenic flaviviruses confer simultaneous protection against infections. The present cDNA sequence encodes dengue virus (DBN)-2/1.VP fusion protein related to the invention. This fusion protein contains attenuated DEN-2 DEX-53 of of comprising a valine at the non-structural protein (NN) 2000 of the comprising a valine at the non-structural protein (NN) 2000 of the comprising a valine at the non-structural protein (NN) 2000 of the contains attenuated DEN-2 DEX-53 of the contains at the non-structural protein (NN) 2000 of the contains at the non-structural protein (NN) 2000 of the contains at the non-structural protein (NN) 2000 of the contains at the non-structural protein (NN) 2000 of the contains at the non-structural protein (NN) 2000 of the contains at the non-structural protein (NN) 2000 of the contains at the non-structural protein (NN) 2000 of the contains at the non-structural protein (NN) 2000 of the contains at the non-structural protein (NN) 2000 of the contains at the non-structural protein contains at the non-structural protein contains at the non-structural protein (NN) 2000 of the contains at the non-structural protein conta

                                                                                                                                                                                                                                                                                                                                                                                                          mutation
                                                                                                                                                                                                                                                                                                                                                                                                                                                      mutation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                mutation
ö
                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to avirulent, immunogenic flavivirus chimeras comprising amino acid mutations in the non-structural proteins of a flavivirus. Chimeric viruses containing the attenuation-mutated non-structural genes of the virus are used as a backbone into which the structural protein genes of a second flavivirus strain are inserted. These chimeric viruses elicit pronounced immunogenicity but lack the accompanying clinical symptoms of viral disease. Attenuated chimeric flaviviruses are combined in a pharmaceutical composition to confer simultaneous immunity against several strains of pathogenic flaviviruses such as dengue virus serotypes DEN-1, DEN-2, DEN-3 and DEN-4. Immunogenic chimican and accompanying chimicans are also used as immunogens or multivalent vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 to confer simultaneous protection against infections. The present CONA sequence encodes dengue virus (DEN)-2/1-VV fusion protein related to the invention. This fusion protein contains attenuated DEN-2 PDK-53V backbone comprising a valine at the non-structural protein (NS3)-250 and the capsid protein (C), premembrane/membrane protein (prW) and an envelope protein (B) from the vaccine strain of Dengue-1 (DEN-1) PDK-13 virus. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Flavivirus, Dengue virus-1; DEN-1; vaccine; infection; virucidal; mutein; avirulent; immunogenic; viral disease; pharmaceutical; mutant; variant;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                      Chimeric flaviviruses that are avirulent and immunogenic, useful for vaccinating against a range of dengue viruses.

The invention relates to avirulent, immunogenic flavivirus chimeras comprising amino acid mutations in the non-structural proteins of a flavivirus. Chimeric viruses containing the attenuation-mutated nonstructural genes of the virus are used as a backbone into which the structural genes of the virus are used as a backbone into which the structural protein genes of a second flavivirus strain are inserted. These chimeric viruses elicit pronounced immunogenicity but lack the accompanying clinical symptoms of viral disease. Attenuated chimeric flaviviruses are combined in a pharmaceutical composition to confer simultaneous immunity against several strains of pathogenic flaviviruses such as dengue virus serotypes DEN-1, DEN-2, DEN-3 and DEN-4. Immunogenic flavivirus chimeras are also used as immunogens or multivalent vaccines to confer simultaneous protection against infections. The present cDNA sequence encodes wild-type, virulent dengue-1 (DEN-1) 16007 virus protein cued for constructing flavivirus chimeras. Dengue virus types 1-4 (DEN-1) contains 5, non-coding region, followed by a capsid protein (C) encoding region, premembrane/membrane protein (prM) encoding region, an envelope protein (E) encoding region, followed by the region encoding non-coding region, and finally a 3, and finally a 3, and finally and final final
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Chimeric flaviviruses that are avirulent and immunogenic, useful for vaccinating against a range of dengue viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Bhamarapravati N;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        S
                                                                                                                                                                  ds; West Nile Virus; envelope protein; glycoprotein E; flavivirus; Japanese encephalitis virus; Dengue virus; St Louis encephalitis virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a diagnostic kit comprising at least one isolated and purified polypeptide comprising a West Nile Virus (WNV) envelope (E) protein or its immunogenic fragment having a native conformation or non-denatured structure and that is reactive with antibodies against WNV and cross-reactive with antibodies against a flavivirus. The diagnostic kit is useful in diagnosing flavivirus flavious the diagnostic kit is useful in diagnosing flavivirus intection caused by DENV, MNV, JNV or SLBV. This sequence corresponds the complete nucleotide sequence of the DENV isolate WestPac.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

New tetravalent vaccine containing a common nucleotide deletion in the 3' untranslated region of dengue types 1, 2, 3, and 4, useful for preventing of disease in humans caused by dengue virus, or for inducing immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              immunostimulant activity or as a waccine. The tetravalent vaccine is useful in the prevention of disease in humans caused by dengue virus. Unlike previous tetravalent vaccine, the new tetravalent vaccine is unique since they contain a common shared attenuating mutation which eliminates the possibility of generating a virulent wild type virus in a subject to be vaccinated since each component of the vaccine possesses the same deltai0 attenuating deletion mutation. The vaccine also is able to induce humoral and cellular responses against al of the (non-structural proteins present in each dengue virus serotype. The present sequence is that of the DENI CME chimeric region DNA which is related to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         tetravalent and containing a common nucleotide deletion in the 3' untranslated region of dengue types 1, 2, 3, and 4. The invention may be useful for the development of compounds with a virucide or

The invention discloses a composition comprising two or more isolated rat or human polynucleotides or a polynucleotide which represents a fragment, or human polynucleotides or a polynucleotide which represents a fragment, or claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a chat increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a compound that regulates the activity of one or more of the polypeptides given in the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more opolypeptides or their antibodies. The polypeptides given in the specification, a method for identifying a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (CMUS), in an animal (e.g. spinal segmental nerve injury (CMUS), chronic constriction injury (CCI) and spared nerve injury (CMUS), in an animal (e.g. spinal segmented is a human DNA (described in Table 3 of the specification) which encodes one of the polypeptides of the invention which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the princed specification, but was not a pharmaceutical composition of the pain of the pain of the polypeptides of the specification which series of the polypeptides of the polypeptides of the invention of the

The invention relates to an isolated nucleic acid expression construct comprising a myogenic promoter, a nucleic acid sequence encoding an insulin-like growth factor I (IGF-I) or its functional biological equivalent, and a 3' untranslated region (3'UTR), which has in vivo expression activity for the encoded IGF-I in a tissue. The myogenic promoter in the isolated nucleic acid expression construct comprises a transcriptional loci from a family of MsF-1, MsF-2, TsF-1, SRE or SP. The 3'UTR is from a skeletal alpha actin gene or from a human growth hormone. The expression construct further comprises transfection-facilitating vector system that is a plasmid, a viral vector, a liposome, or a cationic lipid. The isolated nucleic acid expression construct also comprises a transfection-facilitating polypeptide having a charged for stimulating anglogenesis, or stimulating myogenesis, or elevating levels of an anglogenic factor, or stimulating endogenous production of a shore in a complication of an anglogenic factor, or stimulating endogenous production of a shore in a complication of the stimulating a muscular complications of a shore in a complication of the stimulating endogenous production of a shore in a complication of the stimulating endogenous production of the stimulating endogenous produ expression or activity of the IGF-I, such as diabetes mellitus, ischaemic heart disease, diabetic retinopathy and cerebrovascular disease. The present sequence represents the nucleotide sequence of a skeletal alpha-actin 3'-end fragment, a specific example of the 3'- UTR fragment used in diabetes in a subject. The angiogenic factor comprises a vascular endothelial growth factor (VEGF) or VEGF receptor. The methods and compositions of the present invention are useful for the prevention and/or treatment of diseases or conditions associated with aberrant actin 3'-end fragment, a specific example of the 3'- UT the nucleic acid expression construct of the invention. Claim 6; SEQ ID NO 5; 104pp; English.

Claim 11; SEQ ID NO 1; 104pp; English

The invention relates to an isolated nucleic acid expression construct comprising a myogenic promoter, a nucleic acid sequence encoding an insulin-like growth factor I (IGF-I) or its functional biological equivalent, and a 3 untranslated region (3 UTR), which has in vivo expression activity for the encoded IGF-I in a tissue. The myogenic promoter in the isolated nucleic acid expression construct comprises a transcriptional loci from a family of MBF-I, MEP-2, TEF-I, SRB or SP. The 3 UTR is from a skeletal alpha actin gene or from a human growth hormone. The expression construct further comprises transfection-facilitating vector system that is a plasmid, a viral vector, a liposome, or a cationic lipid. The isolated nucleic acid expression construct also comprises a transfection-facilitating polypoptide having a charged polypoptide and/or poly-1-glutamate. The construct is useful in a method for standard and some construct is useful in a method for the standard contract of the standar compositions of the present invention are useful for the prevention and/or treatment of diseases or conditions associated with aberrant expression or activity of the IGF-I, such as diabetes mellitus, ischaemic heart disease, diabetic retinopathy and carebrovascular disease. The present sequence represents the nucleotide sequence of a plasmid pAV2001, a specific example of the isolated nucleic acid expression construct of levels of an angiogenic factor, or stimulating endogenous production an angiopoletin, or treating a muscular or vascular complications of diabetes in a subject. The angiogenic factor comprises a vascular endothelial growth factor (VEGF) or VEGF receptor. The methods and the invention

AAQ32352

```
AAQ72477 is the DNA sequence which encodes melanoma antigen-1 (MAGE-1). Another melanoma antigen MAGE-3 is encoded by AAQ72470, this is a tumour rejection antigen precursor. Melanomas characterised by the expression of MAGE-3 can be detected, or monitored, by contacting a test sample with an agent that can recognise MAGE-3. The melanoma can be treated by the administration of cytolytic T cells specific for the complex of antigen (the mature rejection antigen derived from MAGE-3) and a human leucocyte antigen (esp. HIA-A1). (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New tumour rejection antigen precursor MAGB3 - useful in treatment and diagnosis of cancer.
                                                                                                Tumour rejection antigen; melanoma antigen-1; MAGE-1; MAGE-3; cancer; cytolytic T cells; antigen D; human leucocyte antigen; 88.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The sequences given in AAQ32352-69 represent a new family of genes referred to as melanoma antigens (MAGS). The cDNAs of this gene family were identified during the isolation of the antigen E gene. The MAGE cDNAs, when tested, did not transfer expression of antigen E, but they did show substantial homology to the antigen E cDNA sequence. The MAGE DNAs share a certain degree of homology with each other and are expressed in tumour cells including several types of human tumor cells as well as in human tumors. MAGE expression is not restricted to melanomas. MAGE refers to a family of tumor rejection antigen ETRAs or melanoma resulting from these genes are referered to as MAGE TRAs or melanoma antigen tumor rejection, antigens resulting from these genes are referered to as MAGE TRAs or melanoma antigen tumor rejection, antigens.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    RNA stability element; gene therapy; muscle atrophy; neurological; muscular disease; systemic disease; aging; trophic factor; haemophilia; clotting factor; atherogenesis; atherosclerotic; cardiovascular; cerebrovascular; peripheral-vascular disease; hormone deficiency; diabetes; transgenic animal; carcinogen; regulatory element; limmune response; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes novel expression vector systems containing RNA stability elements from 3' flanking sequences used for establishing
                                                                                                                                                                  New tumour rejection antigen is useful as a vaccine against cancerous
                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                      This sequence represents the MAGE-1 gene sequence. The invention atometed at the test of a tumour rejection antigen sequence that is useful as a tumour rejection antigen for vaccination against cancerous conditions
                                                                                              Plaen
                                                                                                                                                                                                                                                                                            Sequence 5674 BP; 1276 A; 1644 C; 1569 G; 1185 T; 0 U; 0 Other;

tacilitate enhanced expression in tissues and target expression with tissue specificity. The expression vectors can be used to treat diseases through gene therapy by targeting the vector to specific tissues.

Consider the can be treated include muscle atrophy associated with neurological, muscular or systemic disease, aging by causing tissues to express and express trophic factors, haemophilia by causing tissues to express and excrete clotting factor into the circulation, atherogenesis and atherosclerotic cardiovascular, cerebrovascular or peripheral-vascular atherosclerotic cardiovascular, cerebrovascular or peripheral-vascular catabolism. They can be used to express factors involved in tissue metabolism. They can be used to replace genes of inherited genetic defects or acquired hormone deficiencies e.g. diaberes. To treatsform cells to produce particular proteins or RNA in vitro. To create assessing novel therapeutic methods, assessing the effect of chemical and physical carcinogens and for studying the effect of genes and genetic physical carcinogens and for studying the effect of genes and genetic regulatory elements or livestock improvement. They can be used to induce an immune response. These vectors provide controlled expression of the genes they carry and produce a significantly high level of expression. Using 3.0TR sequences reduces the decay rates of the mRNAs encoded by the a nucleic acid sequence within a tissue. The vectors also vectors which causes increased expression

This is a long-transcript enriched cDNA library (Ref.
Genome Res. 11: 1553-1558 (2001). [PMID: 11544199]). ES
cells were plated at density 3x104/cm2, on gelatin-coated
plates and cultured for 48 hrs at 37 OC. St CO2. Culture
medium: DMEM supplemented with 15% FBS, 2 mM L-glutamine,
                                                                                                                                                                                                                                                                                                                                                                                                                                          A0963B06-5 NIA Mouse Embryonic Stem (ES) cell (Lif+, 48 h, high density) cDNA library (Long) Mus musculus cDNA clone NIA:A0963B06 CN675425
  colon adenocarcinoma, and was then primed with a Not I - oligo(dT) primer. Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3 vector. Library is normalized. Library was constructed by Bento Soares and M. Fatima Bonaldo.
                                                                                                                                                                                                                                            ö

This GSS is part of a random genomic sequencing program of thirteen yeast species: Saccharomyces bayanus var. uvarum, Saccharomyces ervazzii, Zygosaccharomyces rouxii, Saccharomyces kluyverii, Kluyveromyces thermotolearans, Kluyveromyces lactis var. lactis, Kluyveromyces marxianus var. marxianus, Pichia angusta, Debaryomyces hansenii var. hansenii, Pichia sorbitophila, Candida tropicalis and Yarrowia lipolytica. Genomic inserts of 3 to 5 kb were prepared and both extremities were sequenced. See keywords for description of this sequence and for the sequence of the other extremity of this insert.
                                                                            CNSOGEAJ

T3 end of clone AROAA020A08 of library AROAA from strain CBS 732 of Zygosaccharomyces rouxii, genomic survey sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /note="mimilar to Saccharomyces cerevisiae ORF YNL289w [PCL1 ; cyclin, G1/S-specific ]" /evidence=not_experimental
                                                                                                                                                                                                                                                                                                                                                                                                                                    Jouciet, J.L., Aigle, M., Artiguenave, F., Blandin, G., Souciet, J.L., Aigle, M., Bon, E., Brottier, P., Casaregola, S., Bolotin-Fukuhara, M., Bon, E., Brottier, P., Casaregola, S., de-Montigny, J., Dujon, B., Durrens, P., Lepingle, A., Llorente, B., Malpertuy, A., Neuveglise, C., Ozier-Kalogeropoulos, O., Potier, S., Saurin, W., Tekaia, F., Toffano-Nioche, C., Wesolowski-Louvel, M., Wincker, P. and Weissenbach, J. Genomic exploration of the hemiascomycetous yeasts: 1. A set of Fress becties for molecular evolution studies

Washington University School of Medicine
Ist strand of CDNA was synthesized with reverse transcriptase a
oligo(dT) beads, then cDNA was amplified by PCR using modified
SMART primers. The final cDNA was cloned in pAMPI vector in
annealing reaction with Uracil DNA Glycosylase (UDG). Library
constructed by Y.Korshunova and M. Lovett. Library materials
provided by Mills JC & Gordon JI.
Seq primer: -40RP from Gibco

Funding for Cattle EST sequencing was provided by the USDA National

Research Initiative, Project No. 98-35,05-6644, and a grant from
the Japanese Ministry of Agriculture Fisheries and Forestry to
H.A.Lewin and J.E.Womack. Base-calling/Quality scores: PHRED orm
from Mashington University Genome Center.Vector-trimming: Cross_Match
from Mashington University Genome Center PHRAP suite. This sequence
is vector free and at least 150bp in length.

Submitted (01-MAY-2004) Weisshaar B., Max-Planck-Institut fuer Zuechtungsforschung, Carl-von-Linne-Weg 10, Koeln, 50829, Germany This sequence has been recovered from the left border of the T-DNA. It indicates an insertion within the locus defined by BAC clone requence are described in References 1.3. The sequences at edescribed in References 1.3. The sequences at the MPI for Plant Breeding Research in the context of the GABI-Kat project. GABI-Kat is part of the German Plant Genomics program designated GABI. Information on line availability can be found at: http://www.mjz-koeln.mpg.de/GABI-Kat/.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /ecotype="Col-0"
/note="PCR was performed on DNA from Arabidopsis thaliana plants (T1) which were transformed with the T-DNA from vector pAC161 (GenBank accession number: AJ537514). The lines contain one or more T-DNA insertions. The DNA fragment(s) resulting from the PCR were directly sequenced to determine the genomic sequence flanking the insertion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CO727823
UMC-bend_0A02-024-d02 Day 16 Uterus from a pregnant animal bend Bos

/note="Vector: Lambda Zap Express; Site 1: EcoRI; Site 2:
XhoI; Myeloma cells from multiple myeloma patients' bone
marrow were purified by magnetic cell sorting. mRNA were
purified and an oliog d(7)18 primer containing xhoI
restriction site was used to prime first strand synthesis
using M-MIV reverse transcriptase. To protect the CDNAs
from XhoI digestion in subsequent cloning step, the
nucleotide analogue 5-methyl-dCTP was added to the
nucleotide mixture and [a-32P]dATP was added to monitor
the quantity and quality of first strand synthesis. After
second-strand synthesis and blunting of cDNA termini,
ECORI adapters were ligated, followed by kinase treatment
and digestion with XhoI. The cDNAs were then
size-fractionated using Sephacryl 5-500 column and then
ligated into ECORI and XhoI digested Lambda Zap Express
vector. The ligation product was packaged using Gigapack
II packaging extract. The library had primary library were
randomly selected for single pass sequencing."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                An Arabidopsis thaliana T-DNA mutagenized population (GABI-Kat) for flanking sequence tag-based reverse genetics Plant Mol. have been described in detail alsewhere (Soares et al., 1994; Danaldo et al., 1995, Jiang et al., 2001). Total callular RNA form each sample was isolated by using Danaldo et al., 1995, Jiang et al., 2001). Total callular RNA from each sample was isolated by using Danaldo et al., 1995, Jiang et al., 2001). Total callular RNA from each sample was isolated by using the purification with the Oligotex mRNA isolation kit (Qiagen) according to with the Oligotex mRNA isolation kit (Qiagen) according to the manufacturer's instructions. The libraries were constructed by the manufacturer's instructions provided with the SuperScript Danamid System (Invitrogen, cat. no. 18248-013). Bariefly, Imag of Boly(A) + RNA was annealed at GTGCTGCGCGCGC-tag-T19) and reverse transcriped at GJT degrees with SuperScript II (Invitrogen). The 'rag' represents a tissue's fasge specific ten-base sequence identifiar (http://ganome.ulowa.ed/pubboff/coftware.in.) present in the Oligonucleotide used to prime first-strand synthesis. Second strand synthesis was performed with T4 DNA polymerase in the presence of DNA ligase and RNase H. After second strand synthesis was performed with T4 DNA polymerase in the presence of DNA ligated directionally into the Oligonucleotide used to prime first-strand synthesis and dispered with Notl. The cDNAs were ligated to Sall adapters (Invitrogen). After ligation of the inserts, the plasmids were abetroporated into DHIOB bacteria, in the DNAs derived from each developmental stage of a particular tissue were selectroporated into DHIOB bacteria, the plasmids were abetroporated from Ocytes and embryos was quite limiting and was not settingorated into DHIOB bacteria, the plasmids were abetroporated from Ocytes and embryos was quite limiting and was not sufficient for library production with the samular protocol. Therefore, PCR-based protocol was utilian the SMART and derived manular of extracted mRNA was snot setting derived the SMART oligonucleotide (Ciontech) modified to contenin a SMIT afte to penerate full-length E Antoniou, HA Garverick, JA Green, MC Lucy, RM Roberts, MF Smith and RS Youngquist. Genetic Source: Heifers for the project were purchased from Circle A Ranch, Iberia, MO (http://www.circlearanch.com/home.html). These heifers, while not registered have known Angus pedigrees going back at least 4 generations. Samples collected: The samples consisted of the following: germinal vesicle-stage occytes; in vitro derived embryos (2-cell, morula, blastocysts and nuclear transfer blastocyst; in vivo blastocyst and conceptuses (days 8, 14, 16 and 18); corpora lutea (days 3, 5, 8, 14, 16, 18 and 35); our follicles (days 0, non-recruited, recruited, early selected and preovulatory); ovduct (days 0, 3 and 5); endometrium (days 8, 8, 14, 16, 18 and 35); and placenta/embryo from day 35 conceptuses. Expanded descriptions of how the tissues were collected can be found at the following URL: http://genome.nnt.nissouri.edu/Bovine/Methods.html. http://genome.nnt.nissouri.edu/Bovine/Methods.html. Purified cDNA from each PCR reaction was quantitated and maked on an equimolar basis for ligation into the pCNV-BORYC vector. Preliminary Library Characterization: Randomly chosen clones from each library were analyzed by restriction digestion to determine average insert size (96 clones) and by sequencing (-4 96-well plates) to confirm library quality [e.g. the presence of short polyA+ tails,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Description
